EDUCATION

University of South Florida
Bachelor of Science in Computer Science

- Green and Gold Presidential Scholarship
- Dean's Honor List (Fall 2023, Spring 2024, Spring 2025, Spring 2026)
- Coursework:** Data Structures, Analysis of Algorithms, Software System Development, Software Engineering, Computer Architecture, Intro to Artificial Intelligence, Image Processing, NLP, Operating Systems, Secure Coding, Automata Theory

GPA: 3.84/4.0
May 2027

SKILLS

Languages & Frameworks: Python, SQL, C++, JavaScript, FastAPI, React.js, Node.js

ML: scikit-learn, XGBoost, CatBoost, Optuna, NumPy, Pandas, PyTorch, Hugging Face Transformers, LLM Eval

GenAI & Agents: RAG, LangGraph, Model Context Protocol, ChromaDB, Embeddings, Vector Search

Databases & Tools: MongoDB, SQLite, PostgreSQL, AWS, Azure, Docker, Git/GitHub, Linux, CI/CD

Certifications: AWS Certified Cloud Practitioner

EXPERIENCE

Research Assistant | PALM Lab @ University of South Florida
Apr 2026 – Present

- Co-developing multilingual WebArena and VisualWebArena benchmarks for **LLM and vision-language web agents** across Bengali, Urdu, and English; designed a five-condition factorial across four models to isolate linguistic, visual, structural, and cultural failure modes using controlled language and interface variations across web environments.
- Built deterministic benchmark environments with **Python, Playwright, Docker, seeded backends, reset logic, and database and URL validators**; automated task-success scoring from final environment state across search, forms, account workflows, and multi-step transactions for reproducible cross-model and cross-language evaluation.

AI Engineering Intern | NETSOL Technologies Inc.
Jun 2026 – Aug 2026

- Deployed a 12-month attrition pipeline (**XGBoost, CatBoost, Optuna, grouped cross-validation, calibration**) reaching **0.70 PR-AUC**, 5× random baseline, on held-out employees; benchmarked **18+** model families and found results converged near the same ceiling, pointing to missing organizational signals in the available data rather than model choice.
- Co-built an internal **LLM enterprise search assistant(LangGraph, FastAPI, RAG, Text-to-SQL, FastMCP)** with semantic retrieval over **1,500+** document chunks and a **25+** table database schema; diagnosed boilerplate pages dominating retrieved context and added per-URL diversity caps with relevance-threshold fallback to reduce single-source bias.

Senator and Vice-Chair | University of South Florida Student Government
Mar 2024 – Mar 2025

- Drafted **10+** legislative bills as an elected Senator representing **50,000+** USF students, working with university administrators on academic affairs, student housing, campus services, and policy changes affecting the student body.
- Served as **Vice-Chair of the Programming Committee**, setting legislative agendas, chairing meetings, and organizing student town halls for questions, feedback, and direct engagement with Student Government.

PROJECTS

QuietSpot – Crowd-Sourced Noise Map | *React, Python, FastAPI, C, scikit-learn, PostgreSQL* *Sep 2025 – Mar 2026*

- Coded a **full-stack** noise mapping web app using **React, Python/FastAPI, REST API** that crowdsources real-time sound levels via microphones; wrote custom **C** audio engine compiled to WebAssembly for in-browser signal processing
- Modeled a **scikit-learn** noise classifier with **12+** engineered audio features and an active-learning workflow that captures user corrections as labeled data for iterative retraining, enabling the model to improve from real-world feedback over time.

WanderWise | *React.js, JavaScript, Node.js, REST APIs, Serverless Architecture, Duffel API* *Mar 2025 – Jun 2025*

- Developed WanderWise, a full-stack **React 18** application leveraging **RESTful APIs** and **serverless Node.js functions** to asynchronously aggregate live flight and accommodation data into ranked, budget-optimized recommendations
- Made a React travel planner using **Duffel API and Vercel Functions** to search live fares across **6** date windows and **10** destinations, rank budget-fit trips with a custom WanderScore, and surface hotel tiers, budget breakdowns, and results.

Dynamic Graph Shortest Path Visualizer | *C++, STL, Dijkstra's Algorithm, Graph Algorithm* *Aug 2025 – Oct 2025*

- Created a dynamic undirected weighted graph in **C++** using adjacency lists, supporting runtime vertex/edge insertion and removal with validation for self-loops, duplicate edges, missing vertices, invalid weights, and malformed user input.
- Applied **Dijkstra's algorithm** with manual minimum-distance selection and path reconstruction in **O(V²+E)**, supporting shortest-path queries after dynamic graph updates through an interactive CLI with modular **object-oriented** design.
